

## OPERATION ENHANCEMENTS

- **CHANNEL DECODING PROBLEM +** (with Decoder Syster)

1	2	1	X
---	---	---	---

- use kit IF2349 (code: 925 TX 1923) which comprises:  
a shielding printed circuit, RAC:680, earth spring, replacement booklet IF2349 instead of the original FI3343 booklet.

- **RADIO FM BAND PERTURBATION**

1	2	5	X
---	---	---	---

Radio FM band perturbation around 90 MHz caused by frame ICC10 if TV01, TV21, TV41 are of BC337-40

(ITT) type:

- Insert a ceramic capacitor of 1nF between the 12V input (pin 1 of BV02) and the earth (pin 3 of BV02)

- **TV BLOCKED IN PRODUCTION MODE**

The letter "P" appearing in red on the screen: TV set blocked in production mode at factory output level.

- Press the "VOLUME" key to bring down the sound to the minimum and hold it down from five to ten seconds until the letter P in red disappears (exiting the production mode).

### IMPAIRED OPERATION WITH A SATELLITE RECEIVER

The apparatus switches automatically to AV or the last ground programme when the satellite receiver is connected.

- Replace EPROM IR002 by the one carrying the V1.61 release software (code 276TX5042 - 10129090)

3	2	8	7		2	7	6	T	X	5	0	4	2			I	R	0	0	2			D	P	R	M	A	I	N	B	O	A	D	A
---	---	---	---	--	---	---	---	---	---	---	---	---	---	--	--	---	---	---	---	---	--	--	---	---	---	---	---	---	---	---	---	---	---	---

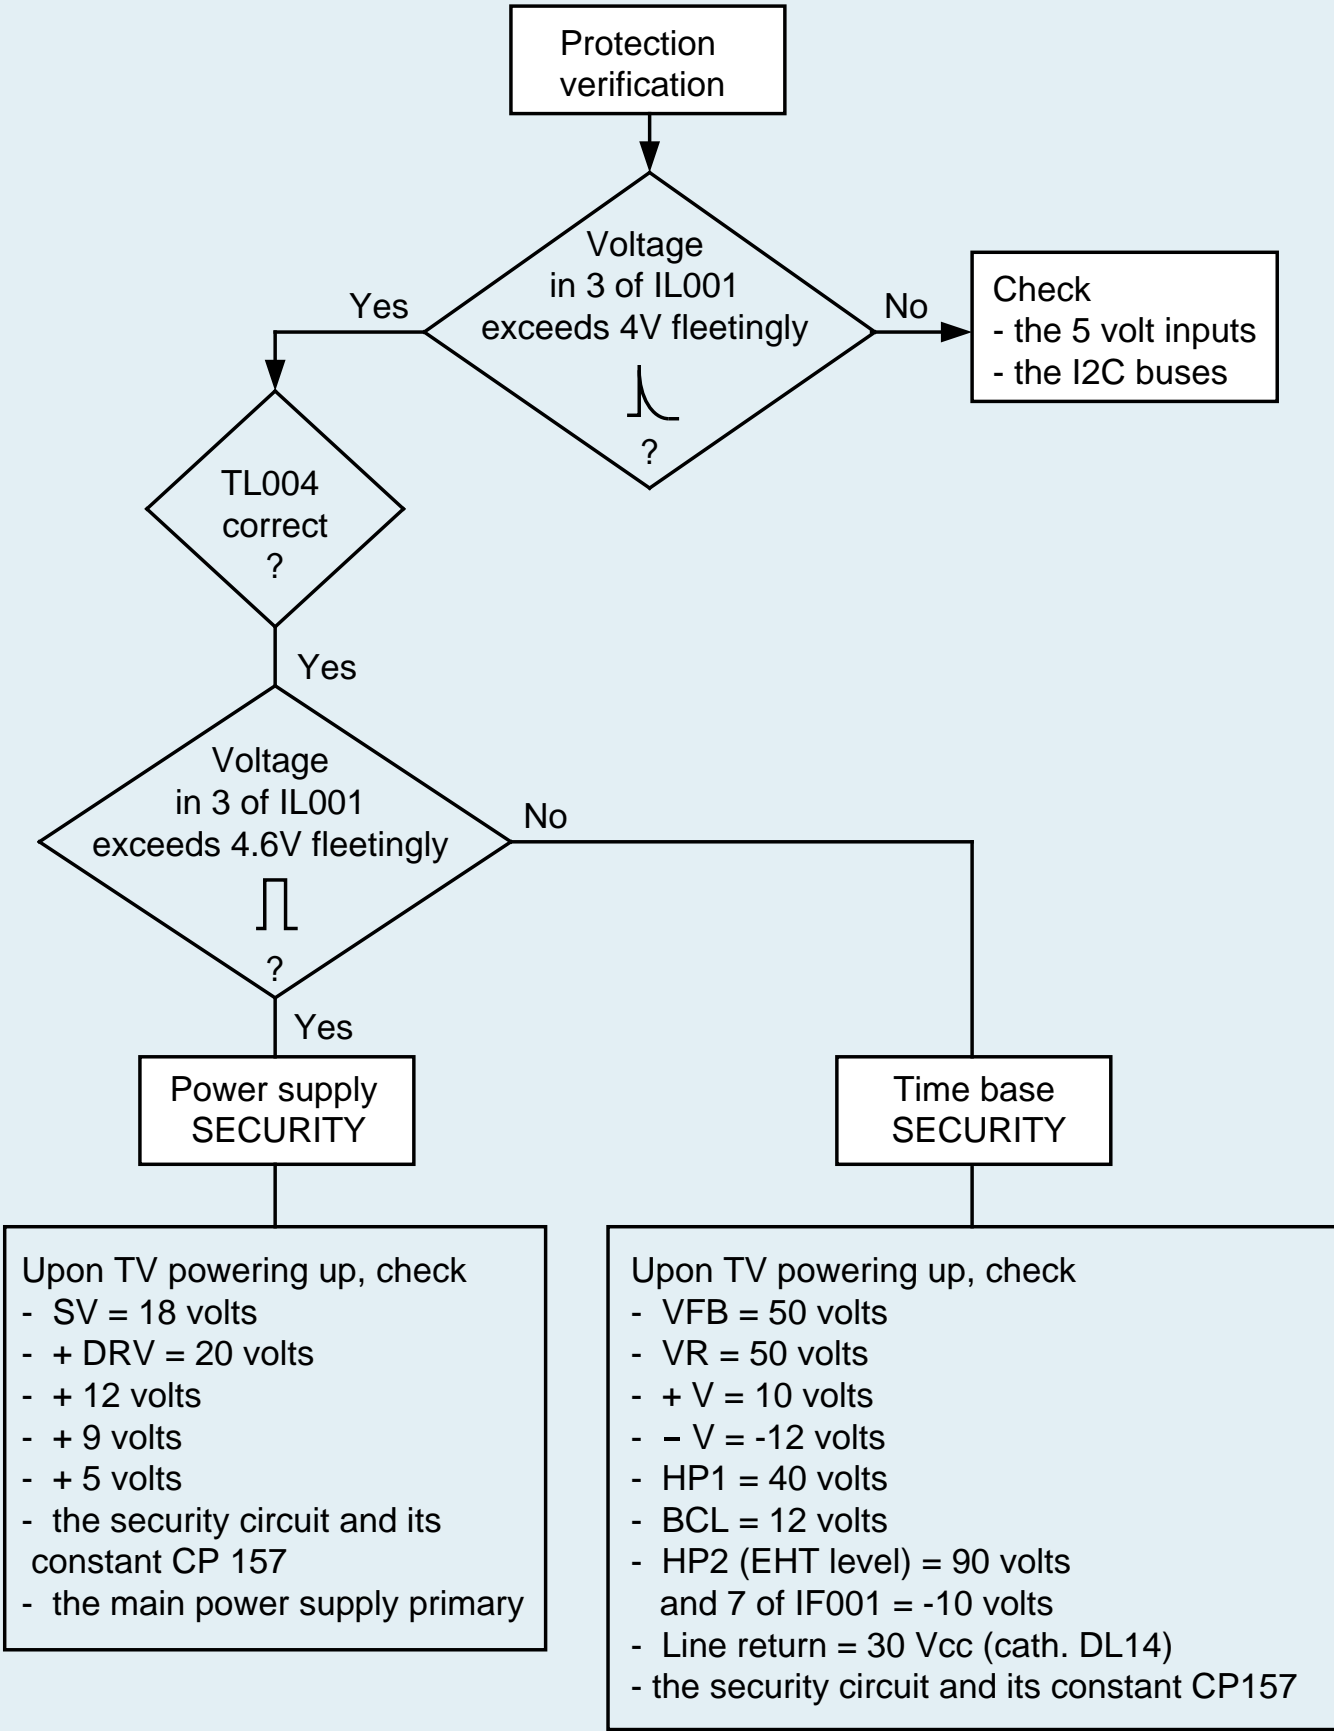

- **PROGRAMMING MENU BLOCKED**  
("PIN code" forgotten by the customer)

- Select the "PIN" code programming menu by means of the yellow key of the remote control device.
- Press simultaneously on the "VOLUME" and "PROGRAMME" commands for 5 seconds to erase the PIN code.

- **IMAGE DESYNCHRONIZED AFTER M/A**

- Check that quartz QV601 is in fact a "PHILIPS" quartz.

# PROTECTION VERIFICATION METHOD

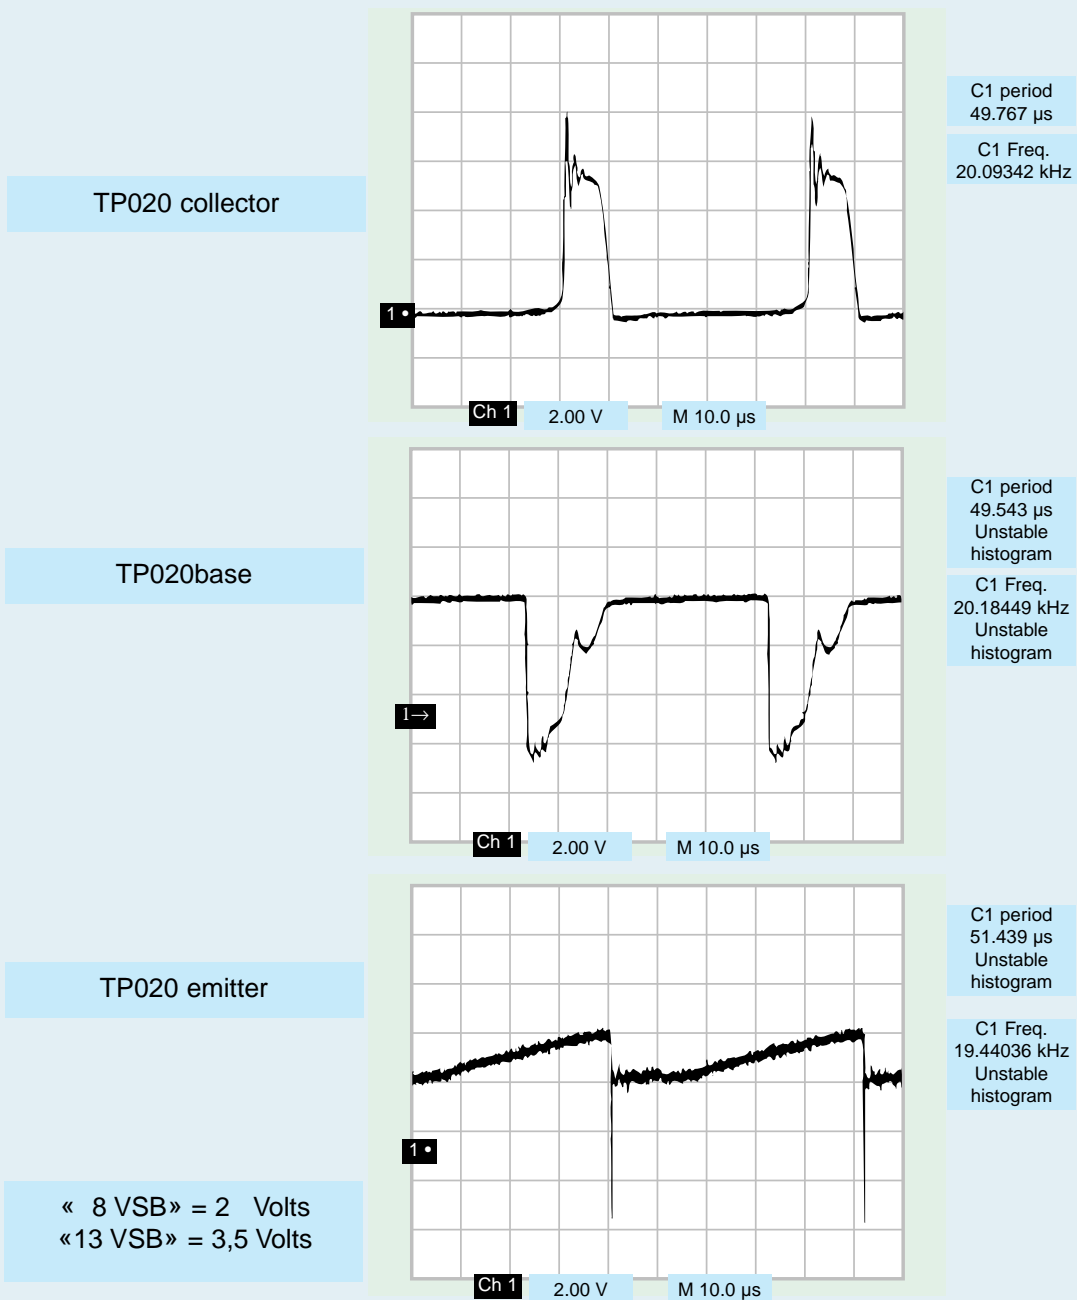

## STAND-BY POWER SUPPLY TROUBLESHOOTING METHOD

### 1. IN LOW VOLTAGE MODE

- discharge capacitors CP062 and CP013
- shunt resistances RP016 through RP020 with a 10k 1/2 W resistance
- power up the frame with a 12VDC input applied through the mains socket

The following situation should ensue:

NB. If nothing happens, disconnect the collector of TP020 and check the presence of about 2V6 at the cathode of the Zener diode DP019.

This method also works if transistors TP021/023/026 are removed.

The signals are significantly dampened in case the "8 VSB" or "13 VSB" is short-circuited.

## 2. IN NOMINAL VOLTAGE MODE (220 VAC)

- remove module VM4000 to force the permanent working of the STAND-BY power supply

The following situation should ensue:

TP020 collector

« 8 VSB » = 8 Volts  
« 13 VSB » = 13 Volts

## VERIFICATION

- Check whether TP026 is not short-circuited

## CHECKING THE MAIN POWER SUPPLY AND THE TIME BASE IN LOW VOLTAGE MODE

discharge capacitors CP013 and CP062

- ground the base of TP051
- connect the primary and secondary earths
- connect the "+" of capacitor CP062 to pin 16 of IP01 and to the cathode of DP116
- ground pin 3 of IL001
- remove the video module
- power up with a 15VDC input through the mains socket or a 12VDC through connector BP61

The following situation should ensue:

pin. 3 of IP120

- reinsert the video module
- short-circuit diode DP127.
- if necessary, call an AV programme.

The following situation should ensue:

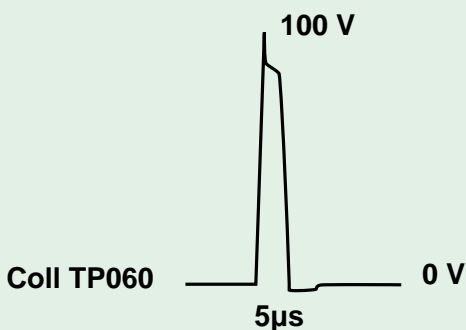

pin. 3 of IP120

connect the cathode of diode DP107 to the "+" of CP062

The following situation should ensue:

U SYST = 68 Volts

Base TL004

## CHECKING THE MAIN POWER SUPPLY IN 220 VAC MODE WITHOUT THE TIME BASE

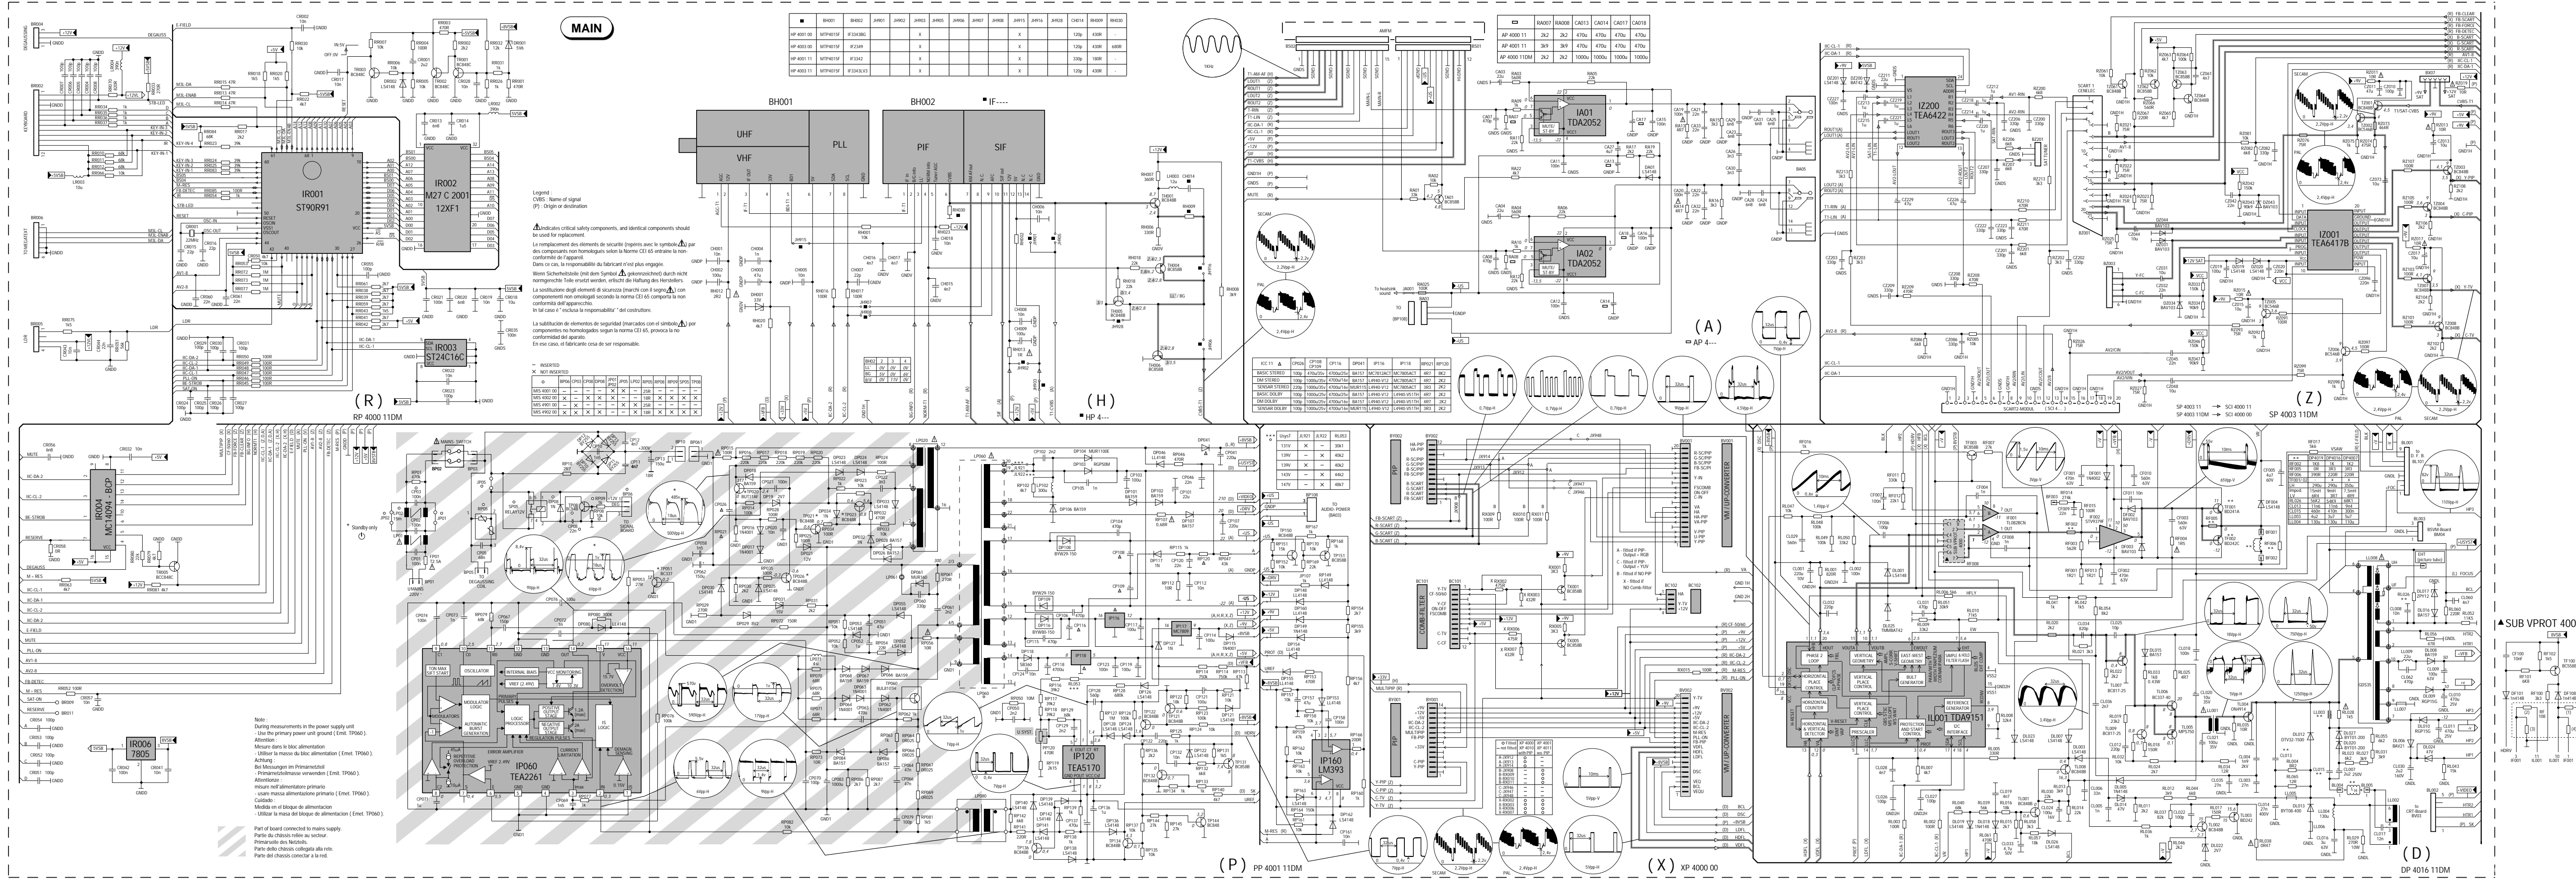

- check the absence of short-circuits on the secondaries
- unsolder pin 4 of the EHT
- connect a 300 ohm 40 W resistance to the SYST V (or a 220 V 75W lamp)
- ground pin 3 of IL001
- short-circuit diode DP127

The following situation should ensue:

- SYST V = 139 or 145 Volts (depending on the frame)
- a 32 kHz working frequency of the power supply
