

Stereo Audio DAC with USB Interface, Single-Ended Headphone Output and S/PDIF Output

Check for Samples: [PCM2704C](#), [PCM2705C](#), [PCM2706C](#), [PCM2707C](#)

FEATURES

- **On-Chip USB Interface:**
 - No Dedicated Device Driver Needed
 - Full-Speed Transceivers
 - Fully Compliant with USB 2.0 Specification
 - USB 1.1 Descriptors with USB Audio Class Support
 - Certified by USB-IF
 - Partially Programmable Descriptors
 - Adaptive Isochronous Transfer for Playback
 - Bus-Powered or Self-Powered Operation
- **Sampling Rates: 32 kHz, 44.1 kHz, 48 kHz**
- **On-Chip Clock Generator with Single 12-MHz Clock Source**
- **Single Power Supply:**
 - Bus-Powered: 5 V, Typical (V_{BUS})
 - Self-Powered: 3.3 V, Typical
- **16-Bit Delta-Sigma Stereo DAC**
 - **Analog Performance at 5 V (Bus-Powered), 3.3 V (Self-Powered):**
 - THD+N: 0.006% $R_L > 10\text{ k}\Omega$, Self-Powered
 - THD+N: 0.025% $R_L = 32\ \Omega$
 - SNR = 98 dB
 - Dynamic Range: 98 dB
 - $P_O = 12\text{ mW}$, $R_L = 32\ \Omega$
 - **Oversampling Digital Filter**
 - Passband Ripple = $\pm 0.04\text{ dB}$
 - Stop-Band Attenuation = -50 dB
 - **Single-Ended Voltage Output**
 - **Analog LPF Included**
- **Multiple Functions:**
 - Up to Eight Human Interface Device (HID) Interfaces (Model and Setting Dependent)
 - Suspend Flag
 - S/PDIF Out with SCMS
 - External ROM Interface (PCM2704C/6C)
 - Serial Programming Interface (PCM2705C/7C)
 - I²S™ Interface (Selectable on PCM2706C/7C)
- **Packages:**
 - 28-Pin SSOP (PCM2704C/5C)
 - 32-Pin TQFP (PCM2706C/7C)

APPLICATIONS

- USB Headphones
- USB Audio Speaker
- USB CRT/LCD Monitor
- USB Audio Interface Box
- USB-Featured Consumer Audio Product

DESCRIPTION

The PCM2704C/5C/6C/7C are TI's single-chip USB stereo audio digital-to-analog converters (DACs) with USB 2.0 compliant full-speed protocol controller and S/PDIF. The USB-protocol controller works with no software code, but USB descriptors can be modified in some areas (for example, vendor ID/product ID) through the use of an external ROM (PCM2704C/6C) or serial peripheral interface (SPI) (PCM2705C/7C). The PCM2704C/5C/6C/7C also employ SpAct™ architecture, TI's unique system that recovers the audio clock from USB packet data. On-chip analog phase-locked loops (PLLs) with SpAct enable playback with low clock jitter.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SpAct is a trademark of Texas Instruments.

System Two, Audio Precision are trademarks of Audio Precision, Inc.

SPI is a trademark of Motorola, Inc.

I²S, I²C are trademarks of NXP Semiconductors.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION

For the most current specification and package information, refer to the Package Option Addendum located at the end of this data sheet or see the respective device product folders at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range unless otherwise noted.

		VALUE	UNIT
Supply voltage	V _{BUS}	-0.3 to 6.5	V
	V _{CCP} , V _{CCL} , V _{CCR} , V _{DD}	-0.3 to 4	V
Supply voltage differences	V _{CCP} , V _{CCL} , V _{CCR} , V _{DD}	±0.1	V
Ground voltage differences	PGND, AGNDL, AGNDR, DGND, ZGND	±0.1	V
Digital input voltage	HOST	-0.3 to 6.5	V
	D+, D-, HID0/MS, HID1/MC, HID2/MD, XTI, XTO, DOUT, SSPND, CK, DT, PSEL, FSEL, TEST, TEST0, TEST1, FUNC0, FUNC1, FUNC2, FUNC3	-0.3 to (V _{DD} + 0.3) < 4	V
Analog input voltage	V _{COM}	-0.3 to (V _{CCP} + 0.3) < 4	V
	V _{OUTR}	-0.3 to (V _{CCR} + 0.3) < 4	V
	V _{OUTL}	-0.3 to (V _{CCL} + 0.3) < 4	V
Input current (any pins except supplies)		±10	mA
Ambient temperature under bias		-40 to +125	°C
Storage temperature		-55 to +150	°C
Junction temperature		+150	°C
Package temperature (IR reflow, peak)		+260	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Over operating free-air temperature range.

		MIN	NOM	MAX	UNIT
Supply voltage	V _{BUS}	4.35	5	5.25	V
	V _{CCP} , V _{CCL} , V _{CCR} , V _{DD}	3	3.3	3.6	
Digital input logic level		TTL-compatible			
Digital input clock frequency		11.994	12	12.006	MHz
Analog output load resistance		16	32		Ω
Analog output load capacitance				100	pF
Digital output load capacitance				20	pF
Operating free-air temperature, T _A		-25		85	°C

ELECTRICAL CHARACTERISTICS

 All specifications at $T_A = +25^\circ\text{C}$, $V_{\text{BUS}} = 5\text{ V}$, $f_s = 44.1\text{ kHz}$, $f_{\text{IN}} = 1\text{ kHz}$, and 16-bit data (unless otherwise noted).

Table 1. Pin Descriptions: DB Package (PCM2704C/PCM2705C)

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AGNDL	12	—	Analog ground for headphone amplifier of L-channel
AGNDR	17	—	Analog ground for headphone amplifier of R-channel
CK	2	O	Clock output for external ROM (PCM2704C). Must be left open (PCM2705C).
D+	9	I/O	USB differential input/output plus ⁽¹⁾
D–	8	I/O	USB differential input/output minus ⁽¹⁾
DGND	6	—	Digital ground
DOUT	5	O	S/PDIF output
DT	3	I/O	Data input/output for external ROM (PCM2704C). Must be left open with pull-up resistor (PCM2705C). ⁽¹⁾
HID0/MS	22	I	HID key state input (mute), active high (PCM2704C). MS input (PCM2705C). ⁽²⁾
HID1/MC	23	I	HID key state input (volume up), active high (PCM2704C). MC input (PCM2705C). ⁽²⁾
HID2/MD	24	I	HID key state input (volume down), active high (PCM2704C). MD input (PCM2705C). ⁽²⁾
HOST	21	I	Host detection during self-powered operation (connect to V_{BUS}). Max power select during bus-powered operation (low: 100 mA, high: 500 mA). ⁽³⁾
PGND	19	—	Analog ground for DAC, OSC, and PLL
PSEL	4	I	Power source select (low: self-power, high: bus-power) ⁽¹⁾
SSPND	27	O	Suspend flag, active low (low: suspend, high: operational)
TEST0	26	I	Test pin. Must be set high ⁽¹⁾
TEST1	25	I	Test pin. Must be set high ⁽¹⁾
V_{BUS}	10	—	Connect to USB power (V_{BUS}) for bus-powered operation. Connect to V_{DD} for self-powered operation.
V_{CCL}	13	—	Analog power supply for headphone amplifier of L-channel ⁽⁴⁾
V_{CCP}	20	—	Analog power supply for DAC, OSC, and PLL ⁽⁴⁾
V_{CCR}	16	—	Analog power supply for headphone amplifier of R-channel ⁽⁴⁾
V_{COM}	18	—	Common voltage for DAC ($V_{CCP}/2$). Connect decoupling capacitor to PGND.
V_{DD}	7	—	Digital power supply ⁽⁴⁾
V_{OUTL}	14	O	DAC analog output for L-channel
V_{OUTR}	15	O	DAC analog output for R-channel
XTI	28	I	Crystal oscillator input ⁽¹⁾
XTO	1	O	Crystal oscillator output
ZGND	11	—	Ground for internal regulator

- (1) LV-TTL level.
 (2) LV-TTL level with internal pulldown.
 (3) LV-TTL level, 5-V tolerant.
 (4) Connect decoupling capacitor to GND. Supply 3.3 V for self-powered applications.

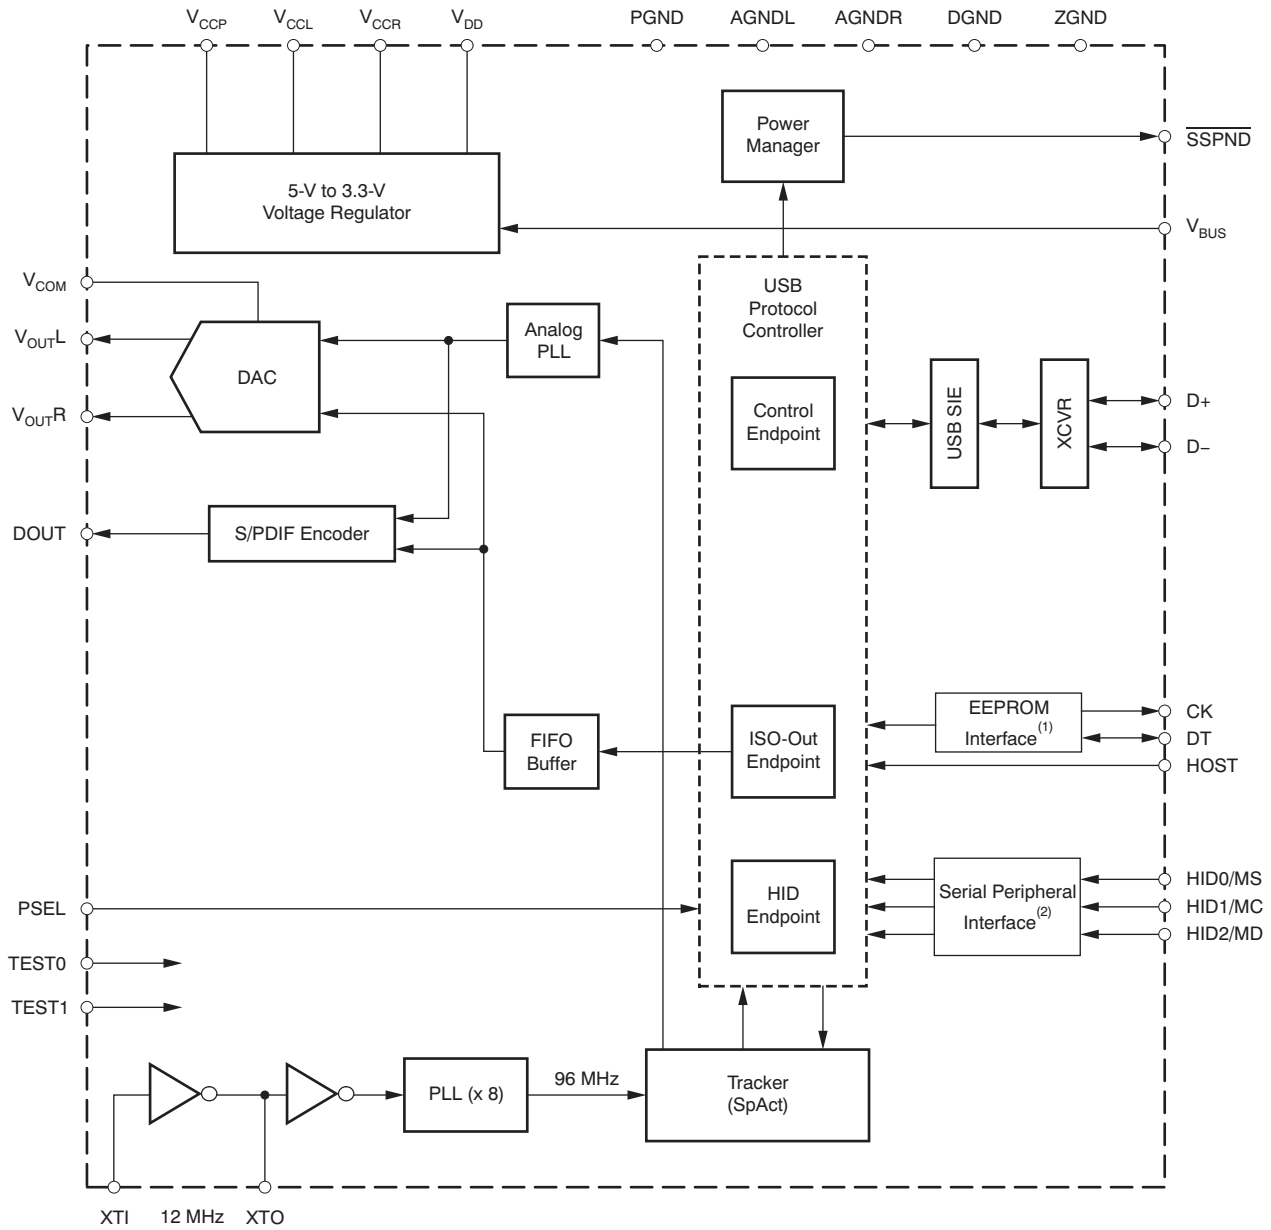

Table 2. Pin Descriptions: PJT Package (PCM2706C/PCM2707C)

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AGNDL	26	—	Analog ground for headphone amplifier of L-channel

DETAILED DESCRIPTION

Clock and Reset

For both USB and audio functions, the PCM2704C/5C/6C/7C require a 12-MHz (± 500 ppm) clock that can be generated by the onboard oscillator using a 12-MHz crystal resonator. The 12-MHz crystal resonator must be connected to the XTI pin (pin 28 for the PCM2704C/5C, pin 12 for the PCM2706C/7C) and the XTO pin (pin 1 for the PCM2704C/5C, pin 13 for the PCM2706C/7C) with one large (1-M Ω) resistor and two small capacitors; the capacitance of these components depends on the specified load capacitance of the crystal resonator. An external clock can be supplied from XTI (pin 28 for the PCM2704C/5C, pin 12 for the PCM2706C/7C). If an external clock is supplied, XTO (pin 1 for the PCM2704C/5C, pin 13 for the PCM2706C/7C) must be left open. No clock disabling pin is provided; therefore, it is not recommended to use the external clock supply. SSPND (pin 27 for the PCM2704C/5C, pin 11 for the PCM2706C/7C) cannot use clock disabling.

The PCM2704C/5C/6C/7C have an internal power-on reset circuit, and it works automatically when V_{DD} (pin 7 for the PCM2704C/5C, pin 21 for the PCM2706C/7C) exceeds 2-V typical (1.6 V to 2.4 V), which is equivalent to V_{BUS} (pin 10 for the PCM2704C/5C, pin 24 for the PCM2706C/7C) exceeding 3-V typical for bus-powered applications. Approximately 700 μ s is required until an internal reset release occurs.

Operation Mode Selection

The PCM2704C/5C/6C/7C have the following mode-select pins.

Power Configuration Select/Host Detection

PSEL (pin 4 for the PCM2704C/5C, pin 16 for the PCM2706C/7C) is dedicated to selecting the power source. This selection affects the configuration descriptor. While in bus-powered operation, the maximum power consumption from V_{BUS} is determined by the HOST pin (pin 21 for the PCM2704C/5C, pin 3 for the PCM2706C/7C). For self-powered operation, the HOST pin must be connected to V_{BUS} of the USB bus with a pulldown resistor to detect attach and detach. (To avoid excessive suspend current, the pulldown should be a high-value resistor.) Table 3 summarizes the power configuration select options.

Table 3. Power Configuration Select

PSEL	DESCRIPTION
0	Self-powered
1	Bus-powered
HOST	DESCRIPTION
0	Detached from USB (self-powered)/100 mA (bus-powered)
1	Attached to USB (self-powered)/500 mA (bus-powered)

Function Select (PCM2706C/7C Only)

FSEL (pin 9) determines the function of the FUNC0–FUNC3 pins (pins 4, 5, 18, and 19) and DOUT (pin 17). When the I²S interface is required, FSEL must be low. Otherwise, FSEL must be high. Table 4 lists the functionality of the FUNC0-FUNC3 pins, based on the FSEL pin.

Table 4. Function Select

FSEL	DOUT	FUNC0	FUNC1	FUNC2	FUNC3
0	Data out (I ² S)	LRCK (I ² S)	BCK (I ² S)	SYSCK (I ² S)	Data in (I ² S)
1	S/PDIF data	Next track (HID) ⁽¹⁾	Previous track (HID) ⁽¹⁾	Stop (HID) ⁽¹⁾	Play/pause (HID) ⁽¹⁾

(1) Valid on the PCM2706C only; no function assigned on the PCM2707C.

USB Interface

Control data and audio data are transferred to the PCM2704C/5C/6C/7C via the D+ pin (pin 9 for the PCM2704C/5C, pin 23 for the PCM2706C/7C) and D– pin (pin 8 for the PCM2704C/5C, pin 22 for the PCM2706C/7C). D+ should be pulled up with a 1.5-k Ω ($\pm 5\%$) resistor. To avoid back voltage in self-powered operation, the device must not provide power to the pull-up resistor on D+ while V_{BUS} of the USB port is inactive.

All data to/from the PCM2704C/5C/6C/7C are transferred at full speed. The information shown in [Table 5](#) is provided in the device descriptor. Some parts of the device descriptor can be modified through external ROM (PCM2704C/6C) or SPI™ (PCM2705C/7C).

Table 5. Device Descriptor

DEVICE DESCRIPTOR	DESCRIPTION
USB revision	1.1 compliant
Device class	0x00 (device defined interface level)
Device subclass	0x00 (not specified)
Device protocol	0x00 (not specified)
Max packet size for endpoint 0	8 bytes
Vendor ID	0x08BB (default value, can be modified)
Product ID	0x27C4/0x27C5/0x27C6/0x27C7 (These values correspond to the model number, and the value can be modified.)
Device release number	1.0 (0x0100)
Number of configurations	1
Vendor strings	BurrBrown from Texas Instruments (default value, can be modified)
Product strings	USB AUDIO DAC (default value, can be modified)
Serial number	Not supported

The information given in [Table 6](#) is contained in the configuration descriptor. Some parts of the configuration descriptor can be modified through external ROM (PCM2704C/6C) or SPI (PCM2705C/7C).

Table 6. Configuration Descriptor

CONFIGURATION DESCRIPTOR	DESCRIPTION
Interface	Three interfaces
Power attribute	0x80 or 0xC0 (bus-powered or self-powered, depending on PSEL; no remote wake up. This value can be modified.)
Max power	0x0A, 0x32, or 0xFA (20 mA for self-powered, 100 mA or 500 mA for bus-powered, depending on PSEL and HOST. This value can be modified.)

The information listed in [Table 7](#) is contained in the string descriptor. Some parts of the string descriptor can be modified through external ROM (PCM2704C/6C) or SPI (PCM2705C/7C).

Table 7. String Descriptor

STRING DESCRIPTOR	DESCRIPTION
#0	0x0409
#1	BurrBrown from Texas Instruments (default value, can be modified)
#2	USB AUDIO DAC (default value, can be modified)

Device Configuration

Figure 23 illustrates the USB audio function topology. The PCM2704C/5C/6C/7C have three interfaces. Each interface is enabled by different alternative settings.

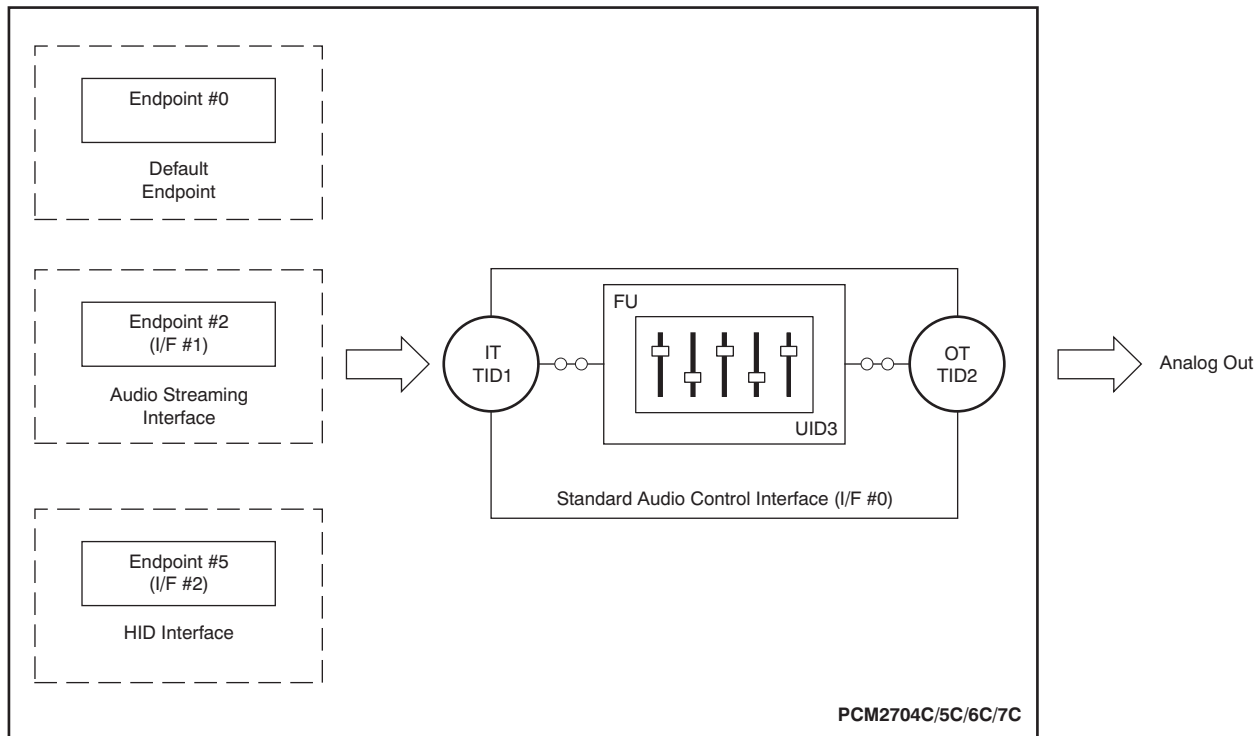

Figure 23. USB Audio Function Topology

Interface #0 (Default/Control Interface)

Interface #0 is the control interface. Setting #0 is the only possible setting for interface #0. Setting #0 describes the standard audio control interface. The audio control interface consists of a terminal. The PCM2704C/5C/6C/7C have three terminals:

- Input terminal (IT #1) for isochronous-out stream
- Output terminal (OT #2) for audio analog output
- Feature unit (FU #3) for DAC digital attenuator

Input terminal #1 is defined as a USB stream (terminal type 0x0101). Input terminal #1 can accept two-channel audio streams consisting of left and right channels. Output terminal #2 is defined as a speaker (terminal type 0x0301). Feature unit #3 supports these sound control features:

- Volume control
- Mute control

The built-in digital volume controller can be manipulated by an audio-class-specific request from 0 dB to –64 dB in steps of 1 dB. Changes are made by incrementing or decrementing one step (that is, 1 dB) for every $1/f_s$ time interval, until the volume level reaches the requested value. Each channel can be set to a separate value. The master volume control is not supported. A request to the master volume is stalled and ignored. The built-in digital mute controller can be manipulated by an audio-class-specific request. A master mute control request is acceptable. A mute control request to an individual channel is stalled and ignored. The digital volume control does not affect either the S/PDIF or I²S outputs (PCM2706C/7C only).

Interface #1 (Isochronous-Out Interface)

Interface #1 is for the audio-streaming data-out interface. Interface #1 has the alternative settings described in [Table 8](#). Alternative setting #0 is the zero-bandwidth setting. All other alternative settings are operational settings.

Table 8. Interface #1 Parameters

ALTERNATIVE SETTING	DATA FORMAT			TRANSFER MODE	SAMPLING RATE (kHz)
00	Zero bandwidth				
01	16-bit	Stereo	Twos complement (PCM)	Adaptive	32, 44.1, 48
02	16-bit	Mono	Twos complement (PCM)	Adaptive	32, 44.1, 48

Interface #2 (HID Interface)

Interface #2 is the interrupt-data-in interface. The HID consumer control device consists of interface #2. Alternative setting #0 is the only possible setting for interface #2.

On the HID device descriptor, eight HID items are reported for any model, in any configuration.

HID Items Reported

Basic HID Operation

Interface #2 can report these three key statuses for any model. These statuses can be set by the HID0–HID2 pins (PCM2704C/6C) or the SPI port (PCM2705C/7C).

- Mute (0xE2)
- Volume up (0xE9)
- Volume down (0xEA)

Extended HID Operation (PCM2705/6/7)

By using the FUNC0–FUNC3 pins (PCM2706C) or the SPI port (PCM2705C/7C), these additional conditions can be reported to the host.

- Play/Pause (0xCD)
- Stop (0xB7)
- Previous (0xB6)
- Next (0xB5)

Auxiliary HID Status Report (PCM2705C/7C)

One additional HID status can be reported to the host through the SPI port. This status flag is defined by SPI command or external ROM. This definition must be described as on the report descriptor with a three-byte usage ID. *AL A/V Capture* (0x0193) is assigned as the default value for this status flag.

Endpoints

The PCM2704C/5C/6C/7C has three endpoints:

- Control endpoint (EP #0)
- Isochronous-out audio data-stream endpoint (EP #2)
- HID endpoint (EP #5)

The control endpoint is a default endpoint. The control endpoint controls all functions of the PCM2704C/5C/6C/7C by standard USB request and USB audio-class-specific request from the host. The isochronous-out audio data-stream endpoint is an audio sink endpoint that receives the PCM audio data. The isochronous-out audio data-stream endpoint accepts the adaptive transfer mode. The HID endpoint is an interrupt-in endpoint. The HID endpoint reports HID status every 10 ms.

The HID endpoint is defined as a consumer-control device. The HID function is designed as an independent endpoint from the isochronous-out endpoint. This configuration means that the effect of HID operation depends on the host software. Typically, the HID function controls the primary audio-out device.

DAC

The PCM2704C/5C/6C/7C have a DAC that uses an oversampling technique with $128\text{-}f_s$, second-order, multi-bit noise shaping. This technique provides extremely low quantization noise in the audio band, and the built-in analog low-pass filter removes the high-frequency components of the noise-shaping signal. The DAC analog outputs, V_{OUTL} and V_{OUTR} , are sent through the headphone amplifier and can provide 12 mW at $32\ \Omega$ as well as $1.8\ V_{PP}$ into a 10-k Ω load.

Digital Audio Interface: S/PDIF Output

The PCM2704C/5C/6C/7C employ S/PDIF output. Isochronous-out data from the host are encoded to S/PDIF output DOUT, as well as to DAC analog outputs V_{OUTL} and V_{OUTR} . The interface format and timing follow the IEC-60958 standard. Monaural data are converted to the stereo format at the same data rate. S/PDIF output is not supported in the I²S I/F enable mode. The implementation of this feature is optional. Note that it is the responsibility of the user to determine whether or not to implement this feature in the end application.

Channel Status Information

Channel status information is fixed, and includes consumer application, PCM mode, copyright, and digital/digital converter data. All other bits are fixed as 0s, except for the sample frequency, which is set automatically according to the data received through the USB.

Copyright Management

Digital audio data output always is encoded as original with SCMS control. Only one generation of digital duplication is allowed.

Digital Audio Interface: I²S Interface Output (PCM2706C/7C)

The PCM2706C and PCM2707C can support the I²S interface, which is enabled by the FSEL pin (pin 9). In the I²S interface-enabled mode, pins 4, 18, 19, 5, and 17 are assigned as DIN, SYSCK, BCK, LRCK, and DOUT, respectively. These pins provide digital output/input data in the 16-bit I²S format, which also is accepted by the internal DAC. I²S interface format and timing are shown in Figure 24, Figure 25, and Figure 26. Table 9 and Table 10 list the audio interface timing and audio clock timing characteristics, respectively.

Figure 24. Audio Data Interface Format

Figure 25. Audio Interface Timing

Table 9. Audio Interface Timing Characteristics⁽¹⁾

SYMBOL	PARAMETER	MIN	MAX	UNIT
t _(BCY)	BCK pulse cycle time	300		ns
t _(BCH)	BCK pulse duration, high	100		ns
t _(BCL)	BCK pulse duration, low	100		ns
t _(BL)	LRCK delay time from BCK falling edge	-20	40	ns
t _(BD)	DOUT delay time from BCK falling edge	-20	40	ns
t _(LD)	DOUT delay time from LRCK edge	-20	40	ns
t _(DS)	DIN setup time	20		ns
t _(DH)	DIN hold time	20		ns

(1) Load capacitance of LRCK, BCK, and DOUT is 20 pF.

Figure 26. Audio Clock Timing

Table 10. Audio Clock Timing Characteristics⁽¹⁾

SYMBOL	PARAMETER	MIN	MAX	UNIT
t _(SLL) , t _(SLH)	LRCK delay time from SYSCK rising edge	-5	10	ns
t _(SBL) , t _(SBH)	BCK delay time from SYSCK rising edge	-5	10	ns

(1) Load capacitance is 20 pF.

DESCRIPTOR DATA MODIFICATION

The descriptor data can be modified through the I²C™ port by external ROM (PCM2704C/6C) or through the SPI port by an SPI host such as an MCU (PCM2705C/7C) under a particular configuration of the PSEL and HOST pins. Setting both the PSEL and the HOST pins high is necessary to modify the descriptor data; the D+ pin pull-up resistor must not be activated before programming the descriptor data through the external ROM or SPI port is completed. The descriptor data must be sent from an external ROM to the PCM2704C/6C or from the SPI host to the PCM2705C/7C in LSB first format, with a specified byte order. Additionally, the power attribute and max power contents must be consistent with the PSEL setting and the power usage from the USB V_{BUS} of the end application. Therefore, descriptor data modification in self-powered configuration (PSEL = low) is not supported.

External ROM Descriptor (PCM2704C/6C)

The PCM2704C/6C support an external ROM interface to override internal descriptors. Pin 3 (for the PCM2704C) or pin 15 (for the PCM2706C) is assigned as DT (serial data), and pin 2 (for the PCM2704C) or pin 14 (for the PCM2706C) is assigned as CK (serial clock) of the I²C interface when using the external ROM descriptor. Descriptor data are transferred from the external ROM to the PCM2704C/6C through the I²C interface the first time when the device is activate after a power-on reset. Before completing a read of the external ROM, the PCM2704C/6C reply with *NACK* for any USB command request from the host to the device itself. The descriptor data, which can be in the external ROM, must meet these parameters:

- String descriptors must be described in ANSI ASCII code (1 byte for each character).
- String descriptors are converted automatically to unicode strings for transmission to the host.
- The device address of the external ROM is fixed as 0xA0.

The data bits must be sent from LSB to MSB on the I²C bus. This condition means that each byte of data must be stored with its bits in reverse order. A read operation is performed at a frequency of XT1/384 (approximately 30 kHz). The power attribute and max power contents must be consistent with the end application circuit configuration (the PSEL setting and the actual power usage from V_{BUS} of the USB connector); otherwise, it may cause improper or unexpected PCM2704C/6C operation.

The data must be stored from address 0x00 and must consist of 57 bytes, according to the parameters listed below:

- Vendor ID (2 bytes)
- Product ID (2 bytes)
- Product string (16 bytes in ANSI ASCII code)
- Vendor string (32 bytes in ANSI ASCII code)
- Power attribute (1 byte)
- Max power (1 byte)
- Auxiliary HID usage ID in report descriptor (3 bytes)

Figure 27 illustrates the timing for an external ROM read operation. The timing characteristics are summarized in Table 11.

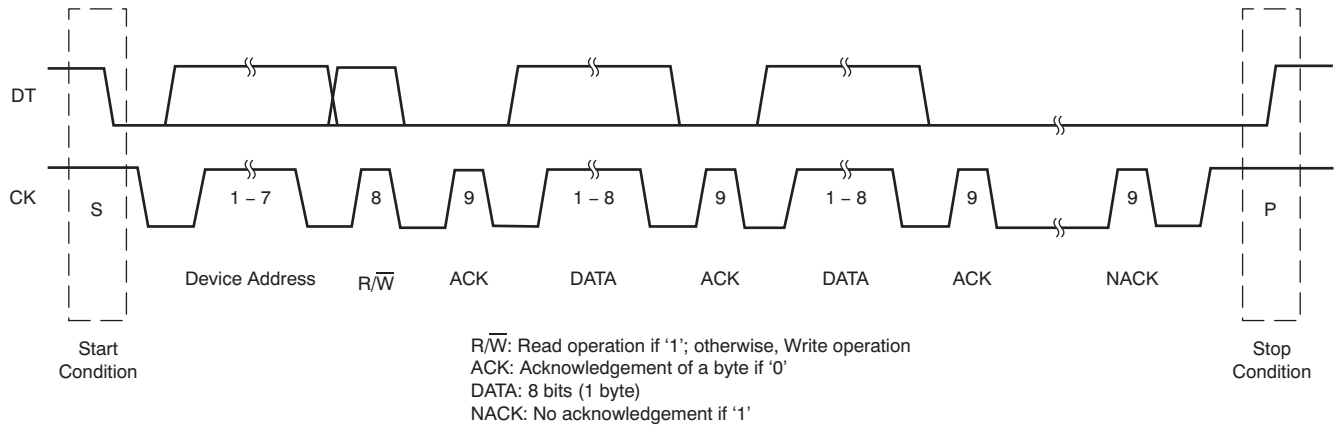

Figure 27. External ROM Read Operation

Table 11. External ROM Read Operation Characteristics

M	M	M	S	S	M	S	M	S	M	M
S	Device address	R/W	ACK	DATA	ACK	DATA	ACK	...	NACK	P

Figure 28 shows the timing for an external ROM read interface. The respective timing characteristics are summarized in Table 12.

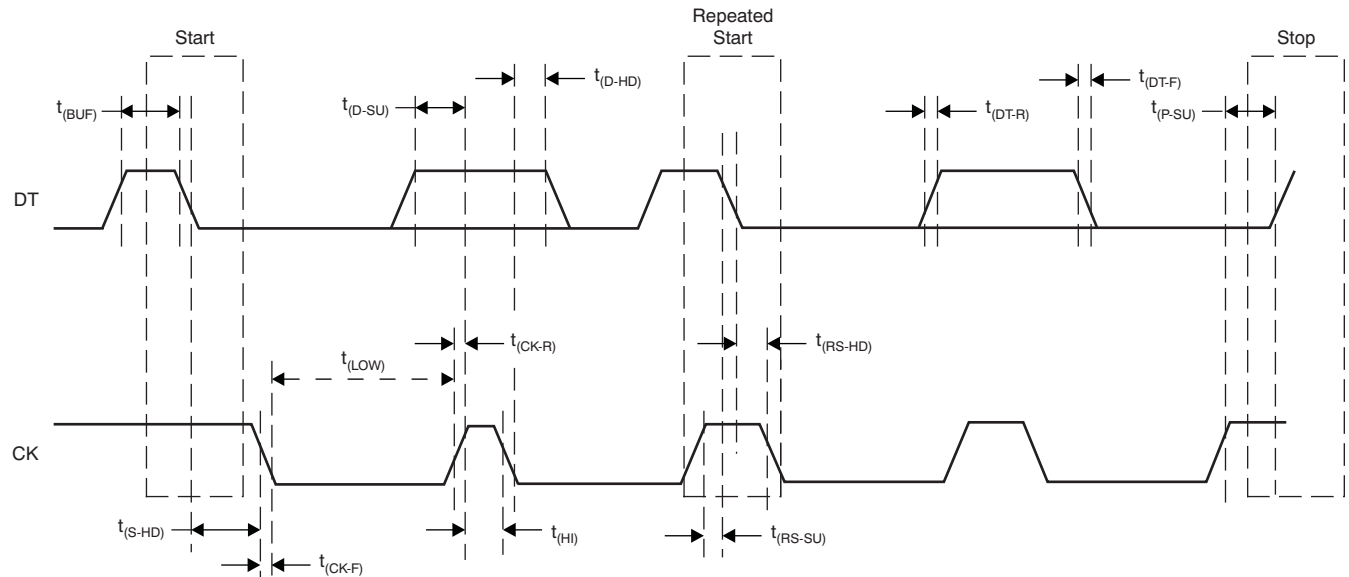

Figure 28. External ROM Read Interface Timing Requirements

Table 12. External ROM Read Interface Timing Characteristics

SYMBOL	PARAMETER	MIN	MAX	UNIT
$f_{(CK)}$	CK clock frequency		100	kHz
$t_{(BUF)}$	Bus free time between a STOP and a START condition	4.7		μ s
$t_{(LOW)}$	Low period of the CK clock	4.7		μ s
$t_{(HI)}$	High period of the CK clock	4		μ s
$t_{(RS-SU)}$	Setup time for START/repeated START condition	4.7		μ s
$t_{(S-HD)}$ $t_{(RS-HD)}$	Hold time for START/repeated START condition	4		μ s
$t_{(D-SU)}$	Data setup time	250		ns
$t_{(D-HD)}$	Data hold time	0	900	ns
$t_{(CK-R)}$	Rise time of CK signal	$20 + 0.1 C_B$	1000	ns
$t_{(CK-F)}$	Fall time of CK signal	$20 + 0.1 C_B$	1000	ns
$t_{(DT-R)}$	Rise time of DT signal	$20 + 0.1 C_B$	1000	ns
$t_{(DT-F)}$	Fall time of DT signal	$20 + 0.1 C_B$	1000	ns
$t_{(P-SU)}$	Setup time for STOP condition	4		μ s
C_B	Capacitive load for DT and CK lines		400	pF
V_{NH}	Noise margin at high level for each connected device (including hysteresis)	$0.2 V_{DD}$		V

```

Explanation

Data are stored beginning at address 0x00.

Vendor ID: 0x08BB

Product ID: 0x2704

Product string: Product strings (16 bytes).

Vendor string: Vendor strings are placed here (32 bytes, 31 visible characters are followed by 1 space).

Power attribute (bmAttribute): 0x80 (Bus-powered).

Max power (maxPower): 0x7D (250 mA).

Auxiliary HID usage ID: 0x0A, 0x93, 0x01 (AL A/V capture).

Note that the data bits must be sent from LSB to MSB on the I²C bus. Therefore, each data byte must be stored with its bits in reverse order.

Serial Programming Interface (PCM2705C/7C)

The PCM2705C/7C supports a serial interface (SPI) to program the descriptor and to set the HID state. Descriptor data are described in the *External ROM Descriptor* section. Figure 29 illustrates the SPI timing; Table 13 lists the respective timing characteristics.

Figure 29. SPI Timing Diagram

Table 13. SPI Timing Characteristics

SYMBOL	PARAMETER	MIN	MAX	UNIT
$t_{(MCY)}$	MC pulse cycle time	100		ns
$t_{(MCL)}$	MC low-level time	50		ns
$t_{(MCH)}$	MC high-level time	50		ns
$t_{(MHH)}$	MS high-level time	100		ns
$t_{(MLS)}$	MS falling edge to MC rising edge	20		ns
$t_{(MLH)}$	MS hold time	20		ns
$t_{(MDH)}$	MD hold time	15		ns
$t_{(MDS)}$	MD setup time	20		ns

Figure 30 shows the SPI write timing sequence.

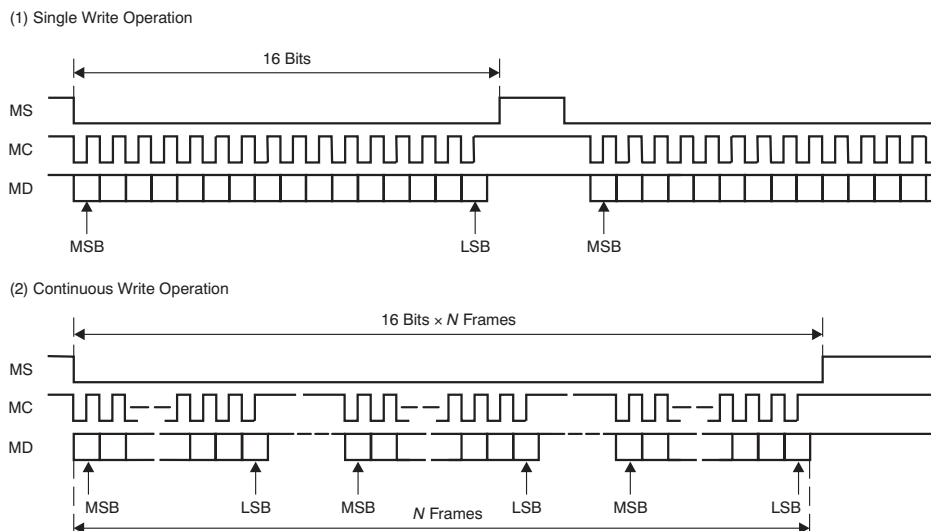

Figure 30. SPI Write Operation

SPI Register (PCM2705C/7C)
Table 14. SPI Register Description

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	0	ST	0	ADDR	0	D0	D1	D2	D3	D4	D5	D6	D7

D[7:0] Function of the lower 8 bits depends on the value of the ST (B11) bit.

ST = 0 (HID status write)

- D7 Reports MUTE HID status to the host (active high)
- D6 Reports volume-up HID status to the host (active high)
- D5 Reports volume-down HID status to the host (active high)
- D4 Reports next-track HID status to the host (active high)
- D3 Reports previous-track HID status to the host (active high)
- D2 Reports stop HID status to the host (active high)
- D1 Reports play/pause HID status to the host (active high)
- D0 Reports extended command status to the host (active high)

ST = 1 (ROM data write)

D[7:0] Internal descriptor ROM data, D0:LSB, D7:MSB

Contents of the power attribute and max power must be consistent with the actual application circuit configuration (the PSEL setting and the actual power usage from V_{BUS} of the USB connector); otherwise, it may cause improper or unexpected PCM2705C/7C operation.

ADDR Starts write operation for internal descriptor reprogramming (active high)

This bit resets the descriptor ROM address counter and indicates that subsequent words should be ROM data (described in the [External ROM Example](#) section). 456 bits of ROM data must be continuously followed after this bit has been asserted. The data bits must be sent from LSB (D0) to MSB (D7).

To set ADDR high, ST must be set low. Note that the lower 8 bits are still active as an HID status write when ST is set low.

ST Determines the function of the lower 8-bit data. [Table 15](#) summarizes the functionality of ST and ADDR bit combinations.

0: HID status write

1: Descriptor ROM data write

Table 15. Functionality of ST and ADDR Bit Combinations

ST	ADDR	FUNCTION
0	0	HIS status write
0	1	HIS status write and descriptor ROM address reset
1	0	Descriptor ROM data write
1	1	Reserved

USB Host Interface Sequence

Power-On, Attach, and Playback Sequence

The PCM2704C/5C/6C/7C are ready for setup when the reset sequence has finished and the USB bus is attached. After a connection has been established (through the set-up process), the PCM2704C/5C/6C/7C are ready to accept USB audio data. While waiting for the audio data (that is, the device is in an idle state), the analog output is set to bipolar zero (BPZ).

Upon receiving the audio data, the PCM2704C/5C/6C/7C stores the first audio packet into the internal storage buffer. The packet contains 1 ms of audio data. The PCM2704C/5C/6C/7C start playing the audio data after detecting the next subsequent start-of-frame (SOF) packet. Figure 31 shows the initial operation sequence for the device.

Figure 31. Initial Sequence

Play, Stop, and Detach Sequence

When the host finishes or aborts playback, the PCM2704C/5C/6C/7C stop playing after the last audio data output is complete. Figure 32 illustrates the play, stop, and detach sequence.

Figure 32. Play, Stop, and Detach Sequence

Suspend and Resume Sequence

The PCM2704C/5C/6C/7C enter a suspended state after the USB bus has been in a constant idle state for approximately 5 ms. While the PCM2704C/5C/6C/7C are in this suspended state, the $\overline{\text{SSPND}}$ flag (pin 27 for the PCM2704C/5C, pin 11 for the PCM2706C/7C) is asserted. The PCM2704C/5C/6C/7C wake up immediately when detecting a non-idle state on the USB bus. Figure 33 shows the operating sequence for the suspend and resume process.

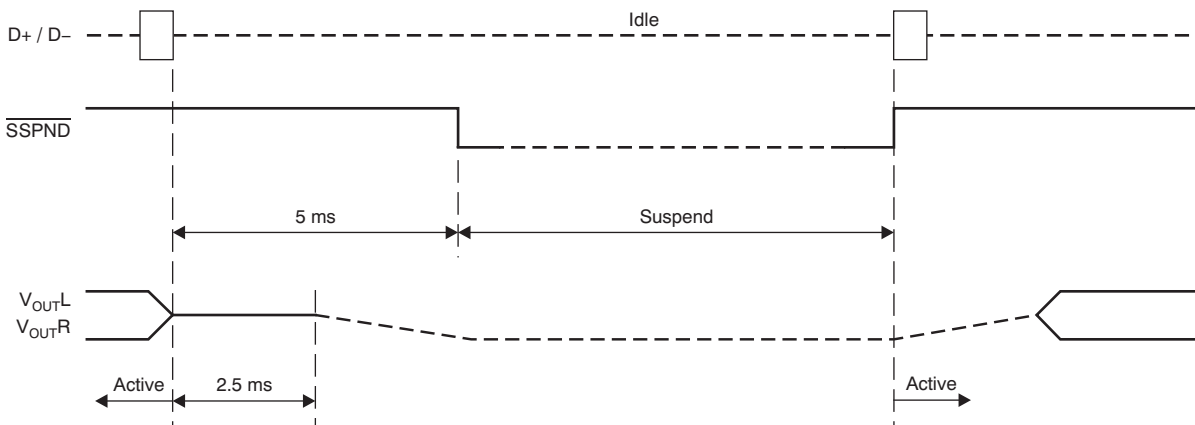

Figure 33. Suspend and Resume

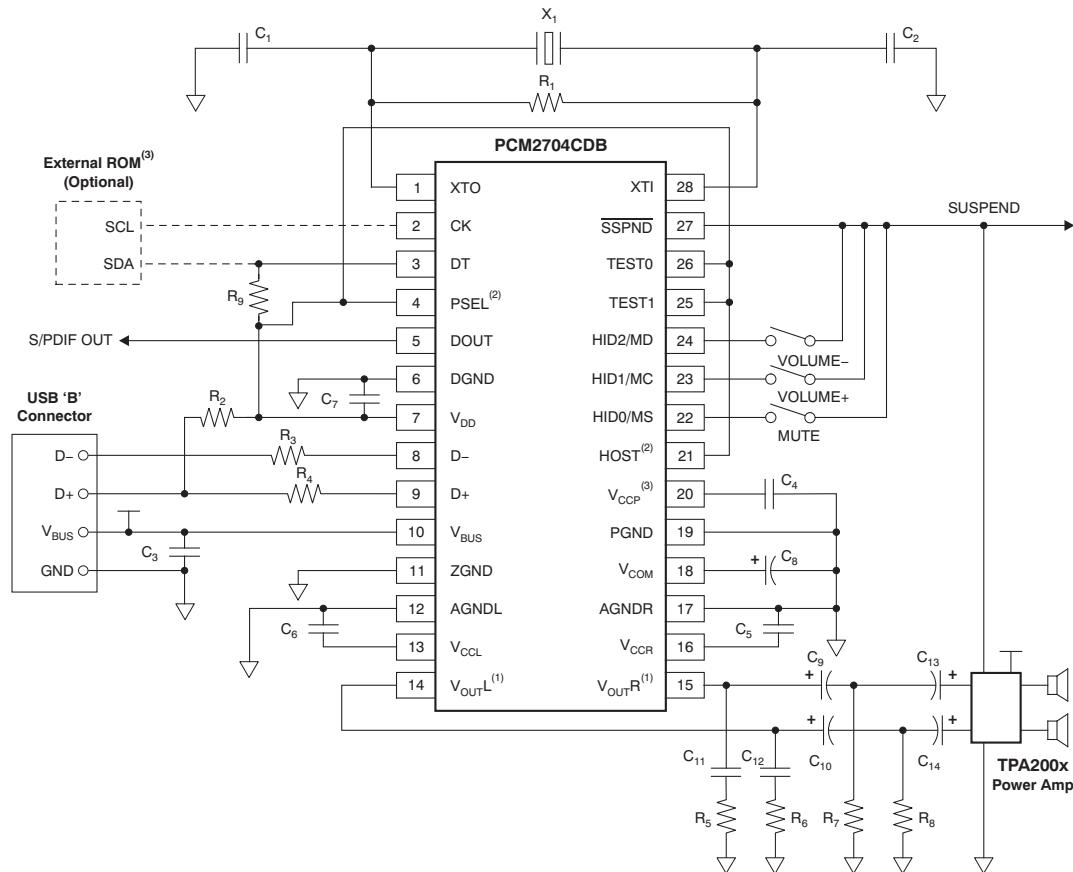

EXAMPLE CIRCUITS

Operating Environment

For current information on the PCM2704C/2705C/2706C/2707C operating environments, see the *Updated Operating Environments for PCM270X, PCM290X Applications* application report, [SLAA374](#), available through the TI website at [www.ti.com](#).

Typical Circuit Connection 1: USB Speaker

Figure 34 illustrates a typical circuit connection for an internal-descriptor, bus-powered, 500-mA application.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitors (depending on load capacitance of crystal resonator). C₃ to C₇: 1-μF ceramic capacitors. C₈: 10-μF electrolytic capacitor. C₉, C₁₀: 100-μF electrolytic capacitors (depending on tradeoff between required frequency response and discharge time for resume). C₁₁, C₁₂: 0.022-μF ceramic capacitors. C₁₃, C₁₄: 1-μF electrolytic capacitors. R₁: 1-MΩ resistor. R₂, R₉: 1.5-kΩ resistors. R₃, R₄: 22-Ω resistors. R₅, R₆: 16-Ω resistors. R₇, R₈: 330-Ω resistors (depending on tradeoff between required THD performance and pop-noise level for suspend).

(1) Output impedance of V_{OUTL} and V_{OUTR} during suspended mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₉ and C₁₀.

(2) Descriptor programming through external ROM is only available when PSEL and HOST are high.

(3) External ROM power can be supplied from V_{CCP}, but any other active component must not use V_{CCP}, V_{CCCL}, V_{CCR}, or V_{DD} as a power source.

Figure 34. Bus-Powered Application

NOTE

The circuit illustrated in Figure 34 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

Typical Circuit Connection 2: Remote Headphone

Figure 35 illustrates a typical circuit connection for a bus-powered, 100-mA headphone with seven HID.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitors (depending on load capacitance of crystal resonator). C₃ to C₅, C₇, C₈: 1-μF ceramic capacitors. C₆: 10-μF electrolytic capacitor. C₉, C₁₀: 100-μF electrolytic capacitors (depending on required frequency response). C₁₁, C₁₂: 0.022-μF ceramic capacitors. R₁: 1-MΩ resistor. R₂, R₁₁: 1.5-kΩ resistors. R₃, R₄: 22-Ω resistors. R₅, R₆: 16-Ω resistors. R₇ to R₁₀: 3.3-kΩ resistors.

(1) Output impedance of V_{OUTL} and V_{OUTR} during suspend mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₉ and C₁₀.

(2) Descriptor programming through external ROM is only available when PSEL and HOST are high.

(3) External ROM power can be supplied from V_{CCP}, but any other active component must not use V_{CCP}, V_{CCL}, V_{CCR}, or V_{DD} as a power source.

Figure 35. Bus-Powered Application

NOTE

The circuit illustrated in Figure 35 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

Typical Circuit Connection 3: DSP Surround Processing Amplifier

Figure 36 illustrates a typical circuit connection for an I²S- and SPI-enabled self-powered application.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitors (depending on load capacitance of crystal resonator). C₃, C₄: 1-μF ceramic capacitors. C₅, C₇: 0.1-μF ceramic capacitor and 10-μF electrolytic capacitor. C₆: 10-μF electrolytic capacitors. C₈, C₉: 100-μF electrolytic capacitors (depending on required frequency response). C₁₀, C₁₁: 0.022-μF ceramic capacitors. R₁, R₁₂: 1-MΩ resistors. R₂, R₅: 1.5-kΩ resistors. R₃, R₄: 22-Ω resistors. R₆, R₇: 16-Ω resistors. R₈ to R₁₁: 3.3-kΩ resistors.

- (1) Output impedance of V_{OUTL} and V_{OUTR} during suspend mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₈ and C₉.
- (2) Descriptor programming through SPI is only available when PSEL and HOST are high.
- (3) D+ pull-up must not be activated (high: 3.3 V) while the device is detached from USB or power supply is not applied on V_{DD} and V_{CCX}. V_{BUS} of USB (5 V) can be used to detect USB power status.
- (4) MS must be high until the PCM2707C power supply is ready and the SPI host (the DSP) is ready to send data. Also, the SPI host must handle the D+ pull-up if the descriptor is programmed through the SPI. D+ pull-up must not be activated (high = 3.3 V) before programming of the PCM2707C through the SPI is complete.

Figure 36. Self-Powered Application

NOTE

The circuit illustrated in Figure 36 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Original (August 2011) to Revision A	Page
• Changed product status from Mixed Status to Production Data	1
• Changed Features section to show full compliance with USB2.0 Specification (but still using USB1.1 descriptors)	1
• Changed Description section to show USB2.0 compliance (USB1.1 was absorbed into 2.0 specification)	1

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
