REPARATIEWENKEN

A. Verwijderen van de toetsen 59,60,62,63,64,66,121

Verwijder de drukrol 68.
 Verwijder de kopdragerbeugel 52.
 Verwijder de vergrendelbeugel 53.
 Door de borglip van de betreffende toets iets naar binnen te drukken komt de toets vrij en kan deze uit het chassis geschoven worden.
 Let daarbij op de drukveer 61.

B. Verwijderen van de schakelaar SK-N (111)

Deze schakelaar bestaat uit twee aparte bladveren die rechtstreeks in het chassis bevestigd zijn.
 Soldeer beide verbindingdraden los en maak de soldeerplaatsen op de bladveren goed schoon.
 Verwijder klemring 87 zodat de spoelschotel 92 naar boven geschoven kan worden.
 Verwijder hefboom 509 en maak de verbinding los tussen beugel 91 en 93.
 Buig de borglippen van de bladveren 111 recht.
 Nu kunnen de veren vanuit de bovenzijde uit het chassis genomen worden.

INSTELLINGEN EN KONTROLES

A. Controle van de bandloop en toonasinstelling

- Apparaat in stand "weergave" met de spiegelcassette.
- Wanneer de band bij de toonas naar boven of naar beneden gaat moet de toonas loodrecht worden ingesteld op het vliegwieltaatslager (B. Fig. 1).
- De band moet recht en gestroomlijnd tussen de bandgeleiders en langs de toonas lopen.
- Kleine afwijkingen in dit patroon zijn toelaatbaar, omdat dit bij normale cassettes geen invloed heeft.

Fig. 1

B. Instelling van de vliegwielspeling

- De vliegwielspeling moet voelbaar zijn maar mag niet meer dan 0,3 mm bedragen.
 Instellen door A te verdraaien (Fig. 1).

C. Instelling van tandwielen voor mechanische stop

- Bij vervanging moet op de juiste positie van de beide tandwielen pos. 103 en pos. 107 t.o.v. elkaar gelet worden.
- Zoals Fig. 2 toont moeten de markeringsgaten a en b in de tandwielen precies tegenover elkaar staan, omdat anders looplawaai (tikken) of het niet goed functioneren van de mechanische stop het gevolg is.

Fig. 2

D. Opspoelfricctie 92

De frictiekracht kan worden gemeten met de frictie-meetcassette 4822 305 30054 (811/CTM) in positie "weergave".
 De meetwaarde moet zijn:
 — Opspoelfricctie 40-60 gcm. Toegestane variatie binnen deze waarden 10 gcm. tegenfrictie 4-6 gcm.
 — De frictiekracht wordt bepaald door de schuin oplopende kanten en bladveren. Fig. 3A en B.
 De kracht is instelbaar door de bladveer een aantal nokken te verplaatsen.

Fig. 3

E. Kophoogte o/w kop (Fig. 4)

- Schakel de voedingsspanning van het apparaat uit.
- Schuif de instelmal 4822 402 60245 over de toonas 10 terwijl de drukrol 68 iets teruggetrokken wordt.
- De mal moet zover over de toonas geschoven worden, zodat deze zich in het verlengde van de wiskopbandgeleiders bevindt.
- Met de schroeven a en b kan de o/w kop zodanig ingesteld worden dat de mal precies tussen de bandgeleiders van beide koppen schuift.
- Controleer de bandloop m.b.v. de spiegelcassette.

Fig. 4

F. Bandsnelheid

Met wow en fluttermeter

- Sluit het apparaat (meetpunten $\diamond 5$, $\diamond 6$) aan op de wow en fluttermeter.
- Zet bandselectorschakelaar SK-43 in de stand CrO2.
- Apparaat in stand "weergave" met het 3150 Hz gedeelte van de testcassette SBC126 (4822 397 30038).
- Met de potentiometer in de motor kan de snelheid worden afgesteld. Maximaal toelaatbare afwijking $\pm 2\%$.
- Tevens kan op deze meter de jengelwaarde worden afgelezen. Deze mag maximaal 0,35% bedragen.

Met cassette service set 801/CSS

- Sluit het apparaat via BU-5 (6) aan op de cassette service set.
- Apparaat in stand "weergave" met de 50 Hz zijde van de testcassette.
- Regel met de potentiometer in de motor de zweeping van de testindikator op minimum.

G. Weergave frequentie karakteristiek

- Apparaat in stand "weergave" met testcassette SBC126. De frequenties tussen 40 Hz en 10 kHz moeten liggen binnen Fig. 5.

Fig. 5 23 742A12/A

H. Instellen voormagnetisatiestroom

Bij het instellen van de voormagnetisatiestroom moet een compromis worden gevonden tussen het frequentiebereik en de vervorming.

De richtwaarde is 350 μA wat overeenkomt met 7 mV over 3751 (3752). Meetpunten $\diamond 7$ en $\diamond 8$.

- Bij een goede instelling zal de frequentie karakteristiek als in Fig. 6 curve b verlopen. De 3^e harmonische vervorming moet $\leq 5\%$ zijn.
- Bij een te grote voormagnetisatiestroom worden de hoge tonen te veel verzwakt (Fig. 6 curve c).
- Bij een te kleine voormagnetisatiestroom wordt de vervorming te groot. De frequentie karakteristiek ziet er dan uit volgens Fig. 6 curve a.
- De voormagnetisatie kan worden ingesteld met 3773 (3774). Richtwaarde 7 mV over 3751 (3752).

Meetpunten $\diamond 7$ en $\diamond 8$.

I. Controle frequentie karakteristiek

- Apparaat in stand "Recording" met testcassette SBC126. Bij minder hoge nauwkeurigheidseisen kan ook een normale chromium cassette van goede kwaliteit worden gebruikt.
- Schakel de ALC uit (pin 14 van 1751 aan massa).
- Zet bandselector schakelaar SK-43 in de stand chromium.
- Voer een signaal van 333 Hz toe aan de injectiepunten $\diamond F$ en $\diamond G$.
- Verlaag nu de ingangsspanning met 20 dB. Houdt de ingangsspanning gedurende meting constant.
- Neem enkele frequenties op tussen 40 Hz en 10 kHz.
- Gemaakte opname weergeven en de waarden in een grafiek uitzetten. De grenzen waar binnen de karakteristiek moet liggen zijn aangegeven in Fig. 5. (Indien nodig voormagnetisatiestroom verhogen of verlagen, zie hoofdstuk H).
